

Acupuncture Practitioners Monthly Review Meeting

On 16/05/2015

Venue: Institution of Engineers, Dr. B.R. AmbedkarVeedhi, Bangalore , Lecture Hall No. 1

Agenda:

- 4 -00 PM Zen Meditation
- 4-10 PM Pulse Metabolic Analyser results
- 4-30 PM Preparation of Case Histories
- 5-00 PM Conclusion
- Tea

Kindly confirm participation.

Case History: As narrated by Mr. Srikantan Nair, Thiruvananthapuram.Yoga and Acupuncture practionerPh: 9447151888.

As a yoga therapy and acupuncture therapy practitioner, I have treated many cases successfully with yoga and acupuncture. As I have done Su-Jok acupuncture course, I used to follow Dr. Bhojraj's book -- "Acupuncture - The Drugless path to Good Health"- and treated many patients very successfully for back pain, headache, cold etc.

A boy aged 14 years was referred to me for treatment. He was diagnosed with splenomegaly and was advised to undergo surgery, not by one

doctor but also by another specialist at the earliest to avoid any complications.

As I could not get the formula from the book, I called Dr. Bhojraj for the acupuncture points. Dr. Bhojraj asked me to reduce spleen heat and use the formula in the spleen meridian. To everybody's surprise, his condition improved within 2 treatments. Now almost for 6 months, he is not having any symptoms of splenomegaly and had not undergone the recommended surgery. I am very confident that he would be totally cured without surgery.

I came to Bengaluru to attend not only Auricular Therapy but also to meet Dr. Bhojraj.

What is splenomegaly?

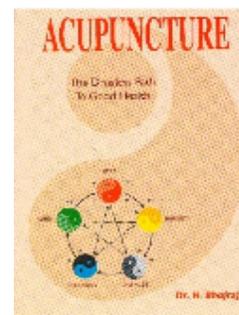

A condition spleen gets enlarged. An enlarged spleen is not always a sign of a problem. When a spleen becomes enlarged, though, it often means it has been doing its job but has become overactive. For example, sometimes the spleen is overactive in removing and destroying blood cells. It can happen for many reasons, including problems with too many platelets and other disorders of the blood.

What are the symptoms ?

Splenomegaly does not have any specific symptoms. Vague abdominal pain and bloating are the most common, but still nonspecific, symptoms of an enlarged spleen. Some individuals with a very enlarged spleen may complain of early satiety (anorexia) and gastric reflux symptoms because of the stomach displacement and pressure on the stomach as a result of the enlarged spleen.

Otherwise many symptoms associated with enlarged spleen are related to the underlying cause of the enlargement.

These may include: fever, night sweats, paleness (pallor), generalized weakness, fatigue, easy bruising, and weight loss.

Sale price Rs. 1,200/-

Order the book by sending sms to 8050901238 or to Mr.Krishnamurthy 9901042415.
